

Dog ratings

Overview

Here we have few conclusions that we derived from our data analysis of the twitter account @dog_rates, also known as WeRateDogs. This page rates dogs their rating is always above 10, because, “Well, they are dogs”. Before we discuss our findings let’s accept the limitations. The findings that we have mentioned below is on the basis of data we have curated and the a small sample set of that data thereby not factoring a lot of things.

Questions and findings

- 1 - What is the highest rating given
- 2 - Value vs count of the rating, mode of rating here, along with visualizing the same

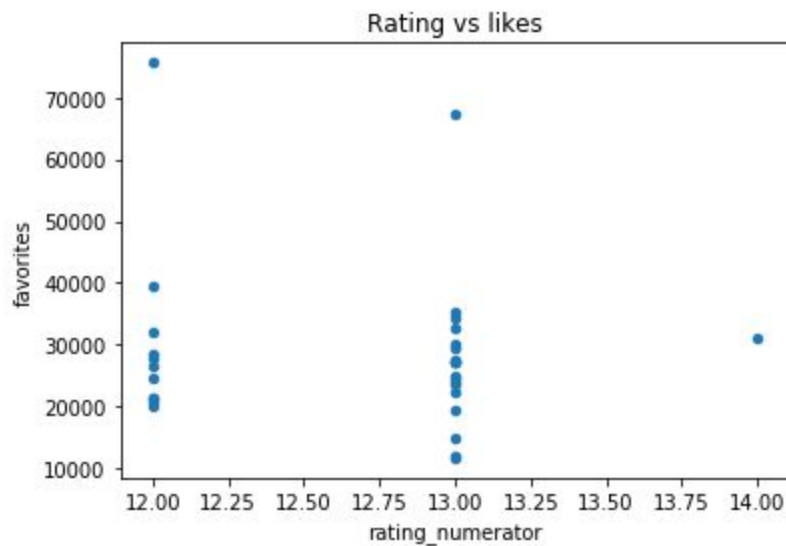

It is clear from the visual that on the basis of our data, the highest rating that a dog has received is 14, however majority of the dogs have received a rating of 13.

Very few of them have received 14.

While a decent chunk has a rating of 12 it seems rating of 11 was too low for dogs has not even a single rating of 11 is present.

3 - Which tweet received the maximum number of likes and what was it's rating

75670

While it may be obvious that the most liked tweet is approximately 75000 likes strong and the rating that the dog had was of 12 only. This is surprising as the dog which had a rating of 14000 received only approx. 32000 likes.

Since the precise most number of likes can't be figured out from the graph, we have extracted the same for you. It's 75670.
